

Alert received. Now what?

The architecture problem that determines whether your response is optimal or not.

SCRM platforms tell you what happened and who is affected.

They stop there.

The hardest question —
"what is the optimal response,
right now, under our actual constraints,
in time to matter?" —
remains unanswered.

↑ Platforms cover this

↑ The gap

Two graphs.

One answers:

what is feasible right now?

The other answers:

what has worked before?

OPERATIONS GRAPH

Your live supply chain

BOMs · Plants · Suppliers

Inventory · Constraints

Answers:

What is feasible?

What is impacted?

RESEARCH GRAPH

25 years of evidence

1,000+ cases · 150+ measures

20+ disruption domains

Answers:

What has worked?

In situations like this?

The connecting layer — the Resilience Intelligence Fabric — matches your current scenario to evidence under your constraints.

Not a playbook.

Two classes of action.

ICA – Immediate Corrective Actions

**Restore production and deliveries
as quickly as possible.**

Ranked by cost, lead time, and feasibility.

Checked against your real constraints.

Not generic. Not hypothetical.

PCA – Permanent Corrective Actions

Eliminate the repeat failure mode.

Why were you exposed? Which structural
levers prevent recurrence? Mined from
patterns across 1,000+ cases.

ICA saves the quarter.

PCA stops the repeat tax.

The evidence behind every recommendation.

1,000+ historical disruption cases

150+ mitigation measures, constraint-tagged

20+ disruption domains covered

25 yrs coverage from 2000 to present

A planner doesn't just need a plan.

They need to understand it.

- **From the first signal,**
not from a summary prepared after the fact.
- **Answers why this option**
ranked above the one that looks cheaper.
- **What-if questions answered**
against the live plan, not a static write-up.
- **Decision stays with your team.**
The Copilot removes context-reconstruction time.

Algorithm aversion peaks during a crisis.

Explainability is not a UX feature.

It is the mechanism that makes the plan usable.

Full architecture research available to download.

The Resilience Intelligence Fabric:

Converting Disruptions into Recovery Plans

- Two-graph architecture explained
- Constraint-aware matching: how it works
- ICA and PCA framework in depth
- 1,000+ case knowledge base — what it covers
- Competitive landscape: where the gap sits
